

## DCS2501 Gateway (Internet)

### Application

The DCS2501 is an Ethernet gateway in System 3000. It allows you to connect to a remote BMS via the Internet.

The DCS2501 features a P90 interface for direct communication with a DDC3000, an HRP or an LRP.

The DCS2501 enables you to replace an existing modem connection with an Internet connection.

## Important Information Regarding Product Safety

### Safety Instructions

This data sheet contains information on installing and commissioning the product "DCS2501". Each person who carries out work on this product must have read and understood this data sheet. If you have any questions that are not resolved by this data sheet, you can obtain further information from the supplier or manufacturer.

If the product is not used in accordance with this data sheet, the protection provided will be impaired.

Applicable regulations must be observed when installing and using the device. Within the EU, these include regulations regarding occupational safety and accident prevention as well as those from the VDE (Association for Electrical, Electronic & Information Technologies). If the device is used in other countries, it is the responsibility of the system installer or operator to comply with local regulations.

Mounting, installation and commissioning work on the devices may only be carried out by qualified technicians. Qualified technicians are persons who are familiar with the described product and who can assess given tasks and recognize possible dangers due to technical training, knowledge and experience as well as knowledge of the appropriate regulations.

### Legend

#### WARNING

Indicates a hazard of medium risk which can result in death or severe bodily injury if it is not avoided.

#### CAUTION

Indicates a hazard of low risk which can result in minor or medium bodily injury if it is not avoided.

#### NOTICE

Indicates a hazard of medium risk which can result in material damage or malfunctions if it is not avoided.

#### NOTE

Indicates additional information that can simplify the work with the product for you.

### Notes on Disposal

For disposal, the product is considered waste from electrical and electronic equipment (electronic waste) and must not be disposed of as household waste. Special treatment for specific components may be legally binding or ecologically sensible. The local and currently applicable legislation must be observed.

| Dimensions              | WxHxD mm 71.8 x 90 x 60, 4 horizontal pitches   |

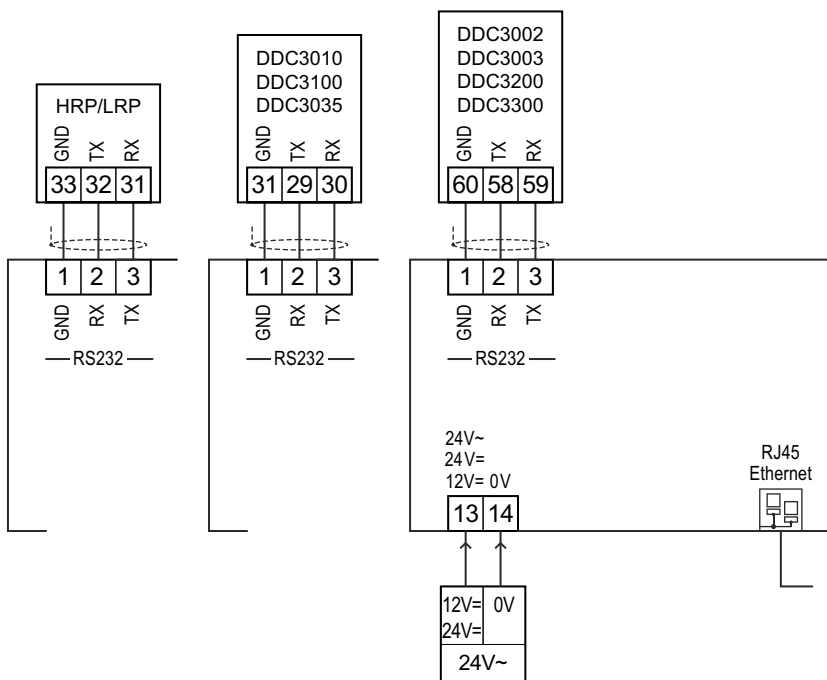

**Compatibility**

The DCS2501 is compatible with BMS version 9.13 or higher. Lower BMS versions are not supported.

Dimensions

Connection

P90

P90 uses RS232 as its bus. RS232 is specified in ANSI EIA/TIA-232-F.

To connect the RS232 bus, use a shielded pair of wires for the data lines (RX and TX) and an additional wire for signal ground (GND).

The maximum cable length for RS232 is 15 m for standard cables, e.g. JY(ST)Y cables with 100 pF/m. If you need to cover larger distances, use a cable with a low capacity. A cable with half the capacity has twice the maximum length.

Example calculation: A Cat7 cable with 40 pF/m allows a length of  $15 \text{ m} \cdot 100 \text{ pF} / 40 \text{ pF} = 37.5 \text{ m}$

Mounting

**NOTICE**

Mount or remove only when power is switched off.

Removal

**NOTICE**

Mount or remove only when power is switched off.

Indicators and Controls

LEDs

- 1 LED RS232: Error
- 2 LED RS232: Data
- 3 LED Power
- 4 LED Ethernet Data
- 5 LED Ethernet Link

| LED                     | Color  | Signal     | Meaning                                      |
|-------------------------|--------|------------|--|
| "LED RS232: Error" (1)  | Red    | Remain lit | No P90 connection                            |
| "LED RS232: Data" (2)   | Green  | Flickering | Data being transferred                       |
| "LED Power" (3)         | Green  | Flashing   | Device is starting/running a firmware update |
|                         |        | Remain lit | Device is ready                              |
| "LED Ethernet Data" (4) | Yellow | Flickering | Data being transferred                       |
| "LED Ethernet Link" (5) | Green  | Remain lit | Connection OK                                |

## Reset button

Pressing the reset button can either restore the device to its initial state or restart the DCS2501. Briefly pressing the reset button restarts the DCS2501. The settings of the DCS2501 are maintained. Pressing the reset button for at least 3 seconds performs a reset. All settings are deleted and the initial state is restored.

1 Reset button

## Restart

- ▶ Ziehen Sie den Ethernet-Stecker vom Gerät ab.  
Dadurch werden Störungen des Netzwerks vermieden.
- ▶ Drücken Sie kurzzeitig den Reset-Taster im Loch (z. B. mit einer Büroklammer).  
Es wird ein Neustart durchgeführt.

## Reset

### NOTICE

Pressing the reset button for longer deletes all the DCS2501's settings and restores it to its initial state.

- ▶ Disconnect the Ethernet connector from the device.  
This prevents the network from being disrupted.
- ▶ Press the recessed reset button for at least 3 seconds (e.g. with a paper clip).  
The device is reset. The device is restored to its initial state.

## Commissioning

### Information for the network administrator

If the DCS2501 and the BMS communicate via the Internet, the DCS2501 requires a public IP address at which it can be reached by the BMS.

The DCS2501 and the BMS can also communicate via NAT if port forwarding is activated for all ports. VPN can also be used, e.g. via the Kieback&Peter technoWay.

The bandwidth required for DCS2501 is less than 200 kbit/s.

The network's "ping" response time must be less than 200 ms.

The network's maximum downtime must be less than 20 ms.

The standard Ethernet MTU should be 1500 bytes. DSL routers often use a smaller MTU. If this is the case, the Ethernet packets from the DCS2501 and the BMS are sent in fragmented form.

Adjusting the router's MTU improves the performance.

If the IP address is assigned via DHCP, the BMS must have a fixed IP address. This fixed IP address will be provided to the Kieback&Peter representative setting up the BMS.

The following ports on the DCS2501 must be accessible from the BMS:

- Port 22 (SSH):  
For encrypted data communication with the BMS.
- Port 23 (SSH/Telnet):  
For low-level analysis of the device by Kieback&Peter Support (optional).
- Port 80 (HTTP):  
For configuring the DCS2501 via the implemented web server (optional).
- Port 19280 (DDC/IPC):  
For configuring the IP address. The IP address can be configured using an XML frame sent as a broadcast (optional).

### Configuring the DCS2501

- ▶ Connect the DCS2501 to your computer with an Ethernet cable. It doesn't matter whether you use a crossover or a non-crossover cable; the DCS2501 automatically identifies the cable.
- ▶ Ensure that the DCS2501 and your computer are connected to the power supply and turned on.
- ▶ Open a web browser on the computer and call up the IP address of the DCS2501. In the default settings:  
**http://192.168.1.1**
- ▶ Select a language by clicking on a flag below the menus in the web interface.

The configuration is available in German and English.

### Log on to the DCS2501

- ▶ Select the **Logon/Logoff** menu.
- ▶ Select **User 3**.
- ▶ Enter the password.

### Rights concept

- User 1
  - Users are automatically User 1 when the DCS2501's web server is called up.
  - Or
  - After every logoff through the **Logon/Logoff** menu.
  - User 1 can only view the settings on the DCS2501, not change them.
- User 3
  - Password: "2460"
  - User 3 can: Change IP and DCS settings, run updates.
- User 4 (all rights)
  - Only available for developers from Kieback&Peter.

**Enter the settings**

- ▶ Enter the information from the table "Planning template DCS2501", on page 13.
- ▶ Enter the network setting information:

- ▶ Click the “Save” button.  
A message appears saying the settings will not be applied until the next time the device is restarted.
- ▶ Enter the device setting information:

**NOTE**

For configuration via NAT, the WAN IP address of the BMS’s router must be used in the device settings of the DCS2501.

For configuration via NAT, the WAN IP address of the DCS2501’s router must be used in the device settings of the BMS.

### Operating mode

The following settings can be chosen as the operating mode:

- **BMS active**

- BMS active means that the BMS establishes the connection to the DCS2501.
- The DCS2501 requires a fixed IP address.

- **DCS active**

- DCS active means that the DCS2501 establishes the connection to the BMS.
- The BMS requires a fixed IP address.

- **Deactivated**

- The DCS2501 is not integrated into the network (not active).

- ▶ Click the “Save” button.

A message appears saying the settings will not be applied until the next time the device is restarted.

- ▶ Restart the device.

- ▶ To do so, click on “System restart” in the menu bar.

### Configuring the controller

- ▶ Configure the following parameters in the DDC3000:

| Parameter                           | Value  |
|-------------------------------------|--|
| 4599/01 =                           | ON   |
| 4600/01 =                           | Baud rate<br>See table "Planning template DCS2501", on page 13 |
| 2051/01 =                           | DST mode   |
| 2031/01 =                           | P90  |
| The modem menu must be deactivated. |  |

#### NOTE

The parameter 2055/01 allows you to check the communication of the DDC3000 to the BMS via the DCS2501.

**Configuring the BMS**

- ▶ Open the “Device configuration” menu on the BMS.
- ▶ Add a new device or change the existing device DCS2501.
- ▶ Enter the settings.
  - ▶ See table "Planning template DCS2501", on page 13

|                          |  |
|--------------------------|--|
| Type:                    | P90  |
| Subtype:                 | <input type="checkbox"/> LRP-HRP<br><input type="checkbox"/> DDC3000                           |
| Connection:              | <input type="checkbox"/> DCS2501 - BMS active<br><input type="checkbox"/> DCS2501 - DCS active |
| DCS identifica-<br>tion: | Example: “DDC3000”   |
| Host:                    | IP address of the DCS  |

**NOTE**

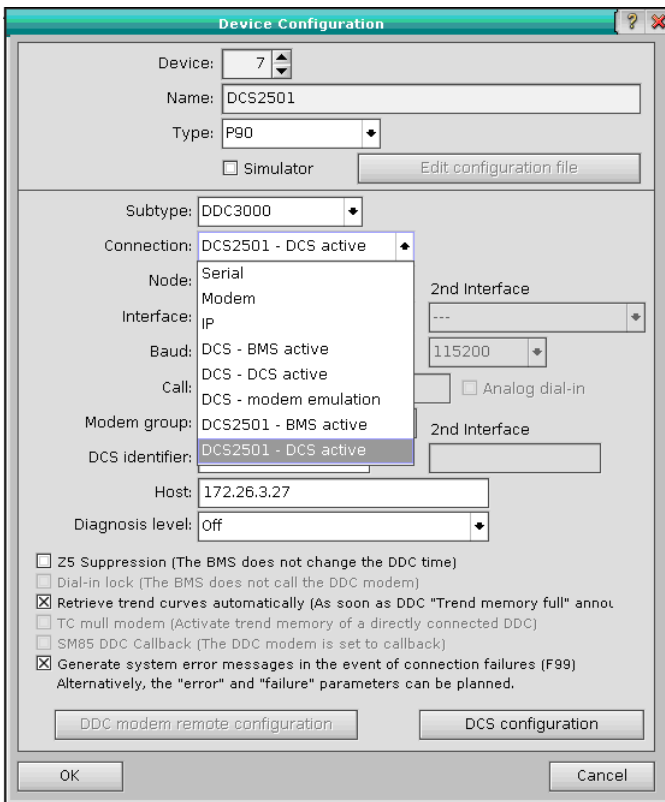

If multiple DCS2501s are used on one BMS, a unique DCS identification must be assigned to each DCS2501.

A valid identification consists of max. 10 characters. Valid characters are A-Z, a-z or 0-9.

**NOTE**

For configuration via NAT, the routers’ IP address must be used.

## Preparation

You need the following information from the network administrator. Protocol the information in this table:

|                     |  |  |
|---------------------|--|--|
| DCS2501             | DCS ID<br>See chapter "Configuring the BMS", page 12.                  |  |
|                     | Operating mode (connection):<br>See: Section Operating mode on page 11 | <input type="checkbox"/> BMS aktive<br><input type="checkbox"/> DCS aktive<br><input type="checkbox"/> Deactivated |
|                     | IP configuration   | <input type="checkbox"/> Manual<br><input type="checkbox"/> DHCP   |
| - Manual            | IP address:  |  |
|                     | Network mask:  |  |
|                     | Gateway:   |  |
|                     | Host name:   |  |
| DDC3000 / HRP / LRP | Baud rate:   |  |
| BMS                 | IP address of the BMS:   |  |
